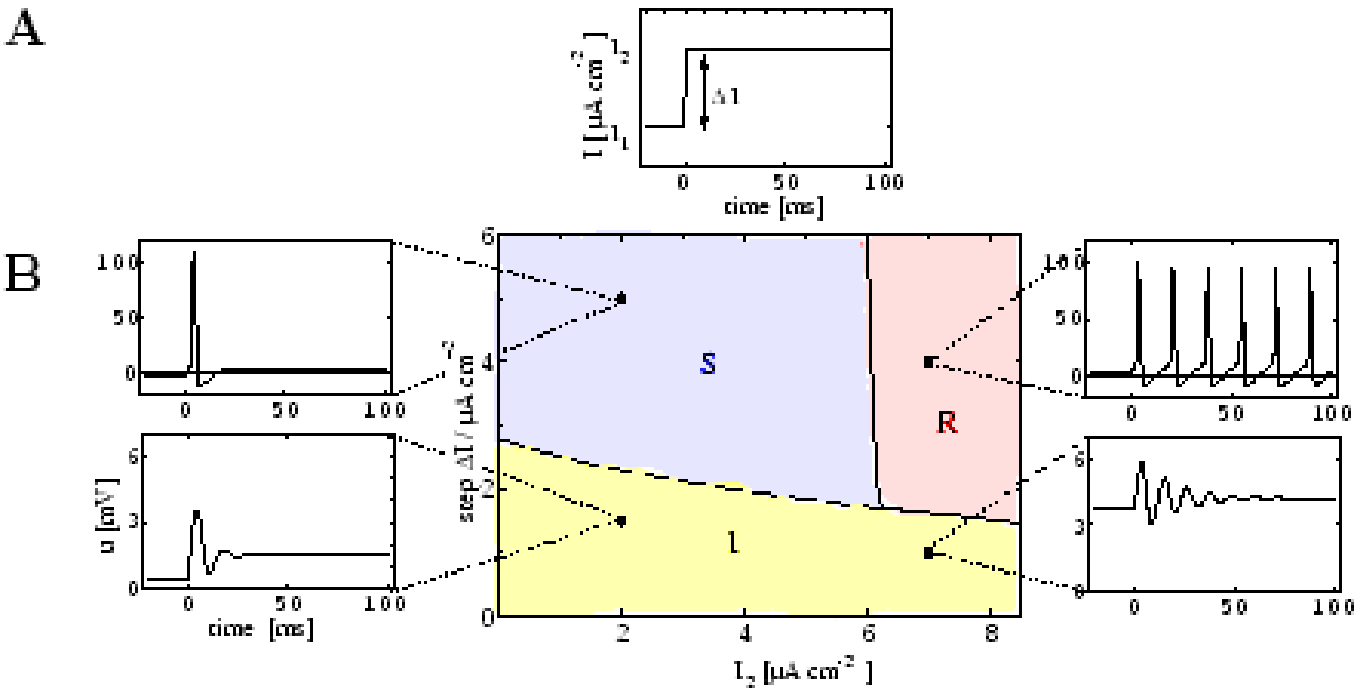
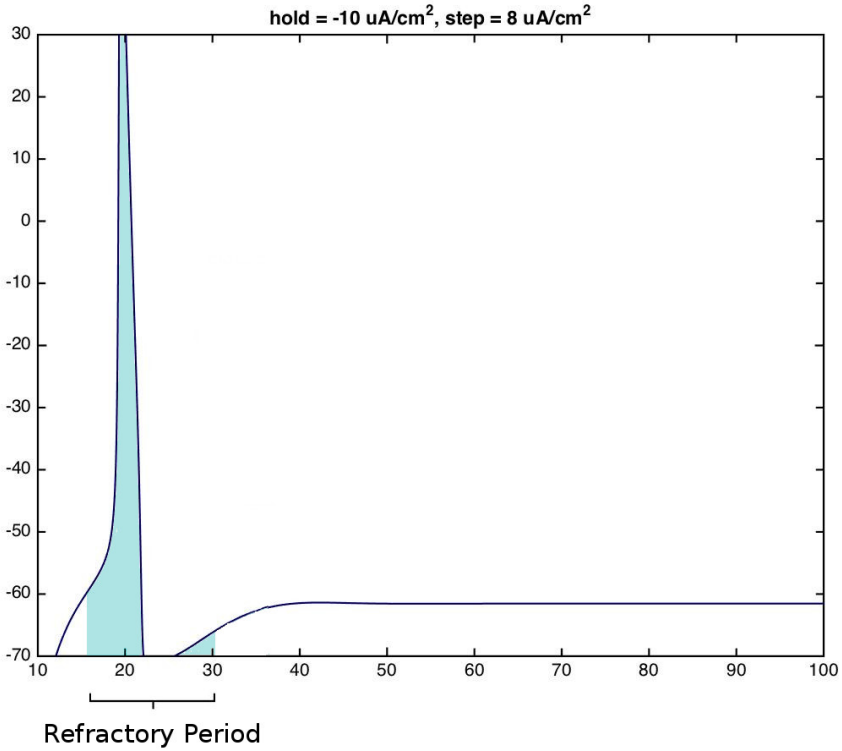
HH Model Step Current Response

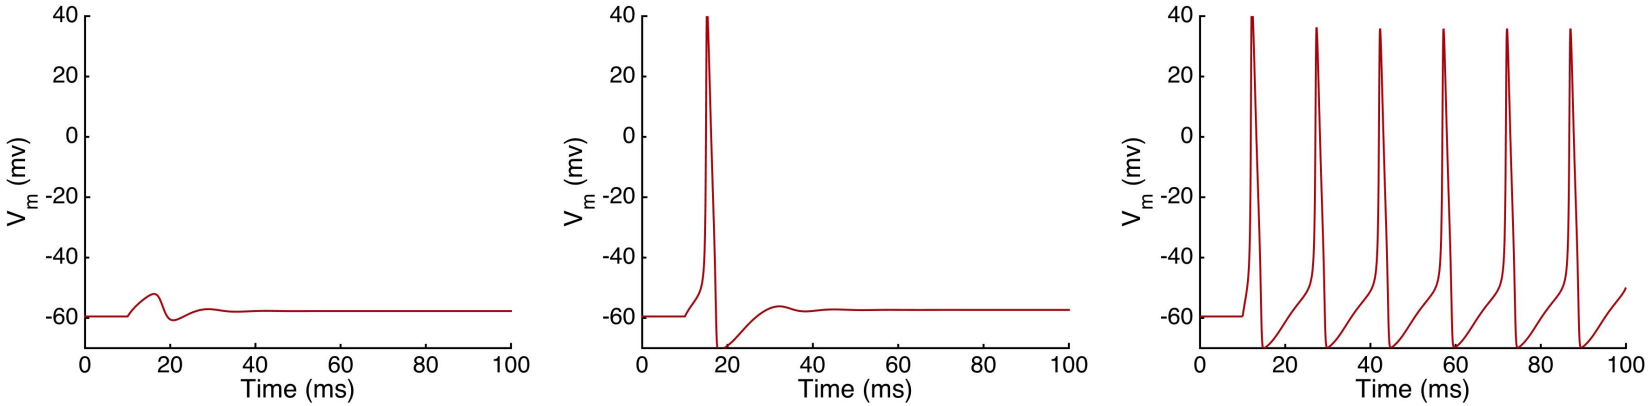


Step Current Stimulation Phase diagram

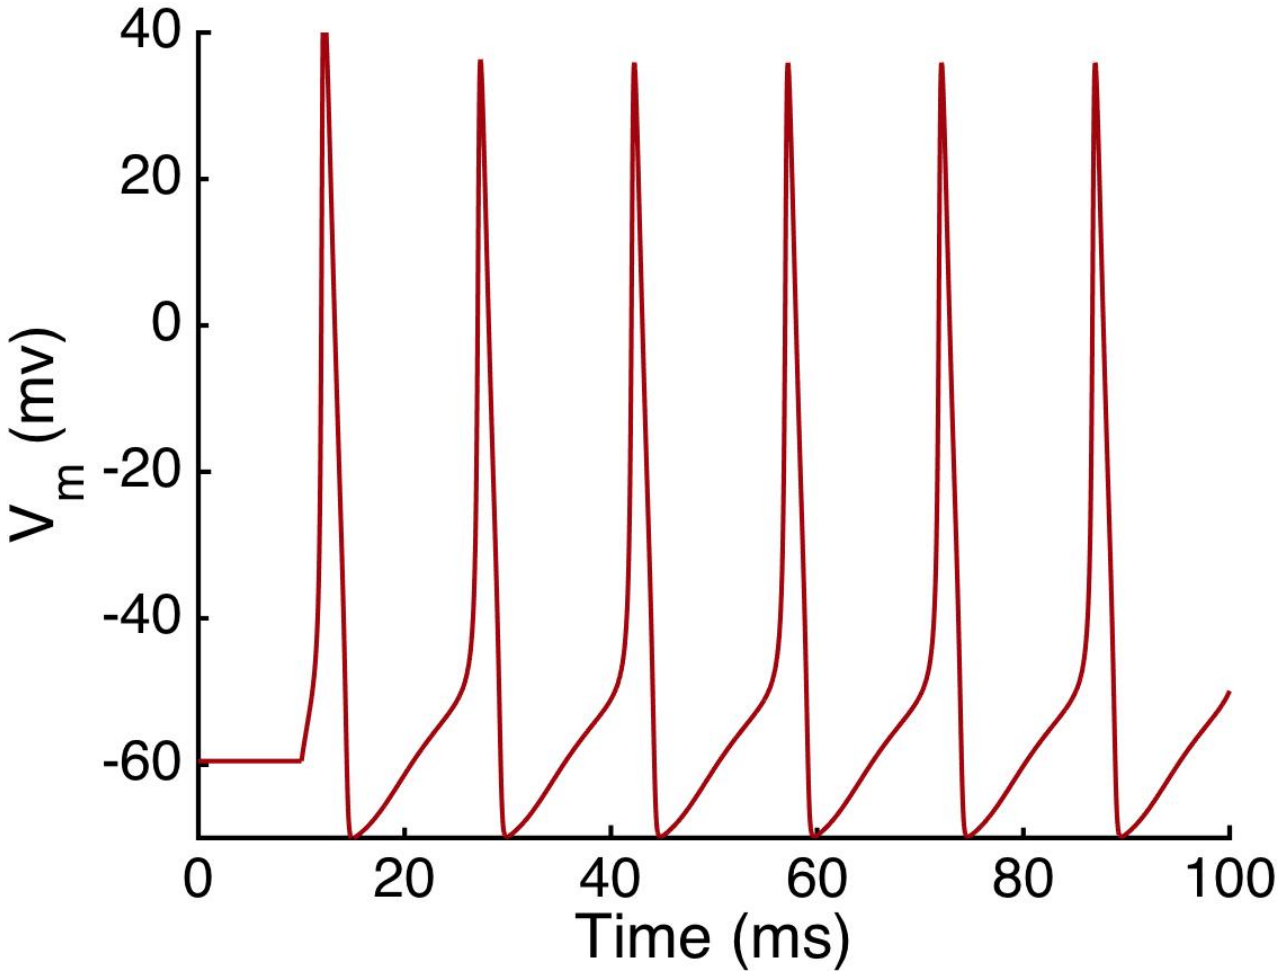
Applications: Refractory Period



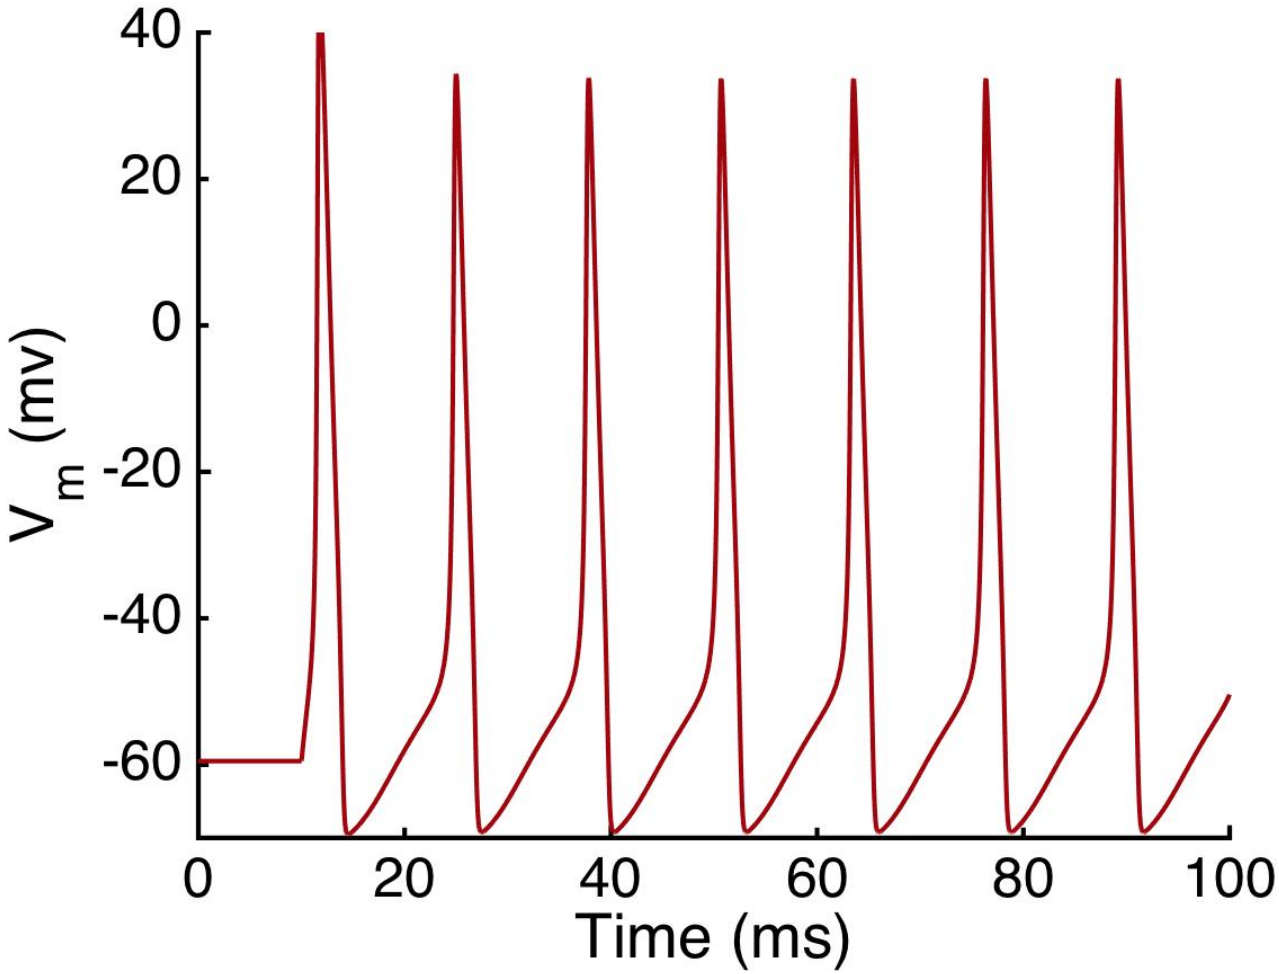
Reducing the Refractory Period can lead to faster reflexes.



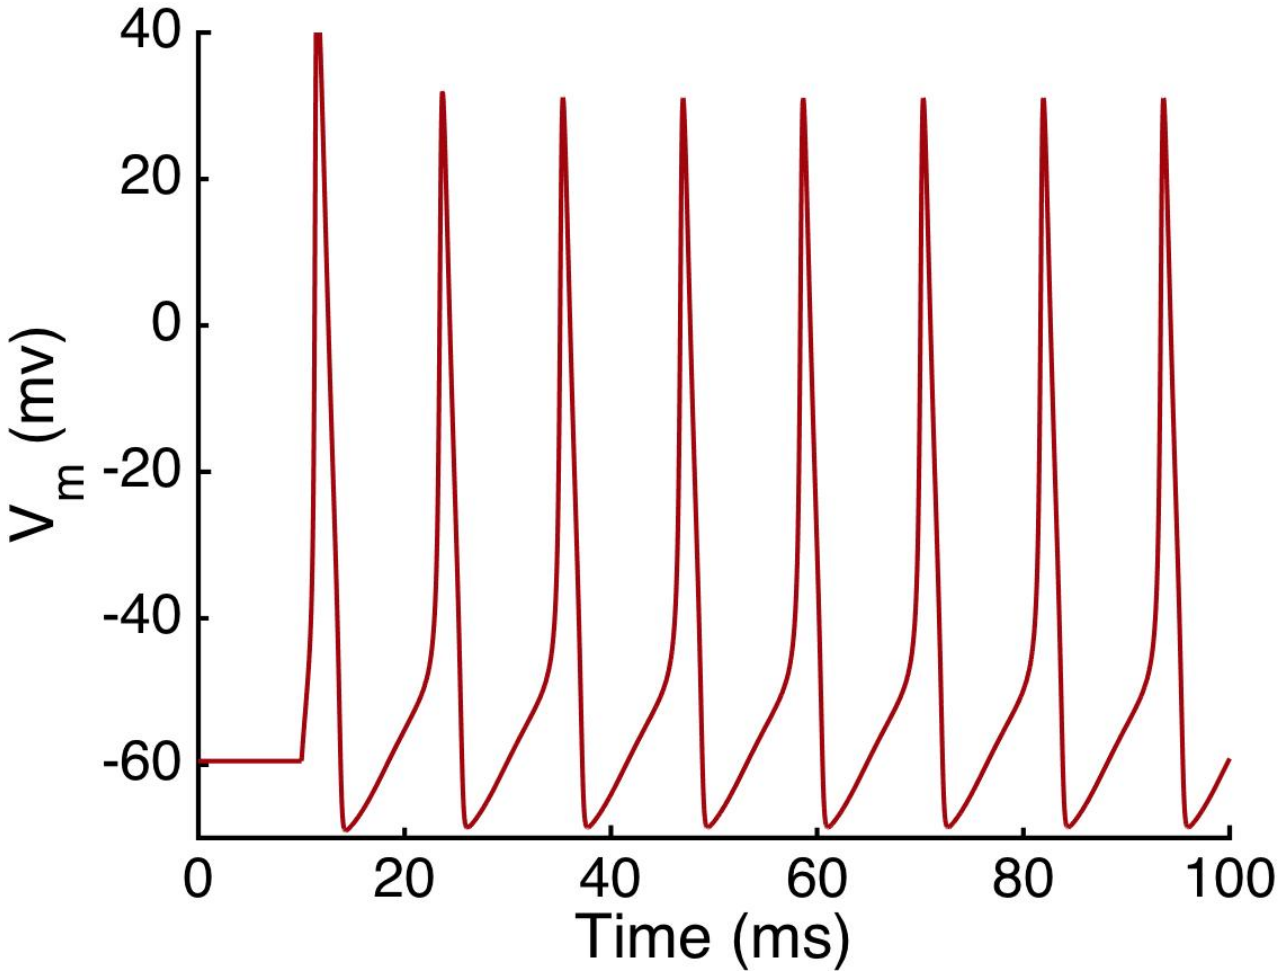
Response in the *Ringing*, *Single AP* and *AP Train* regions



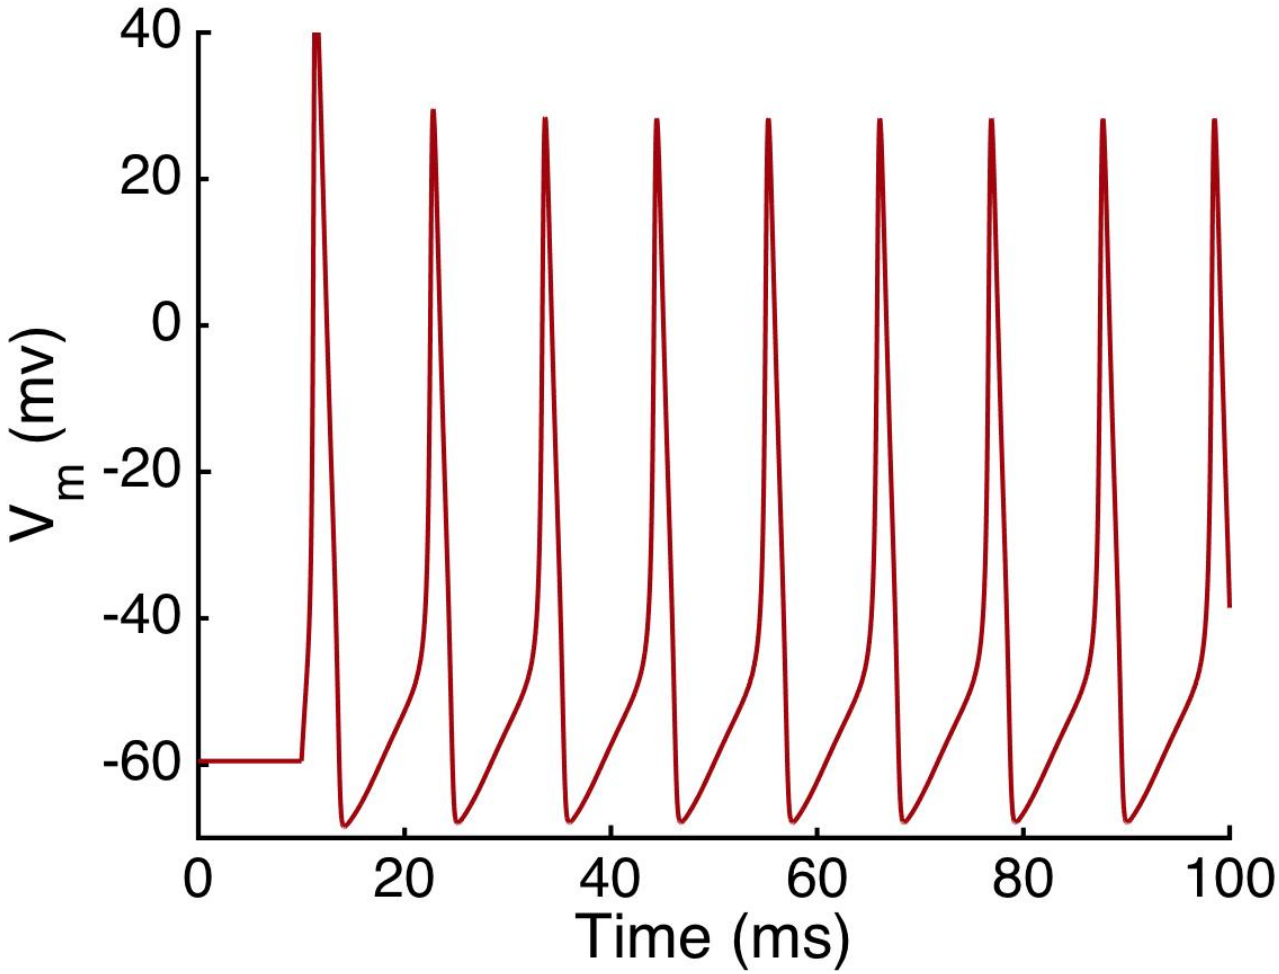
HH Model's step current response starting at 0 $\mu A/cm^2$



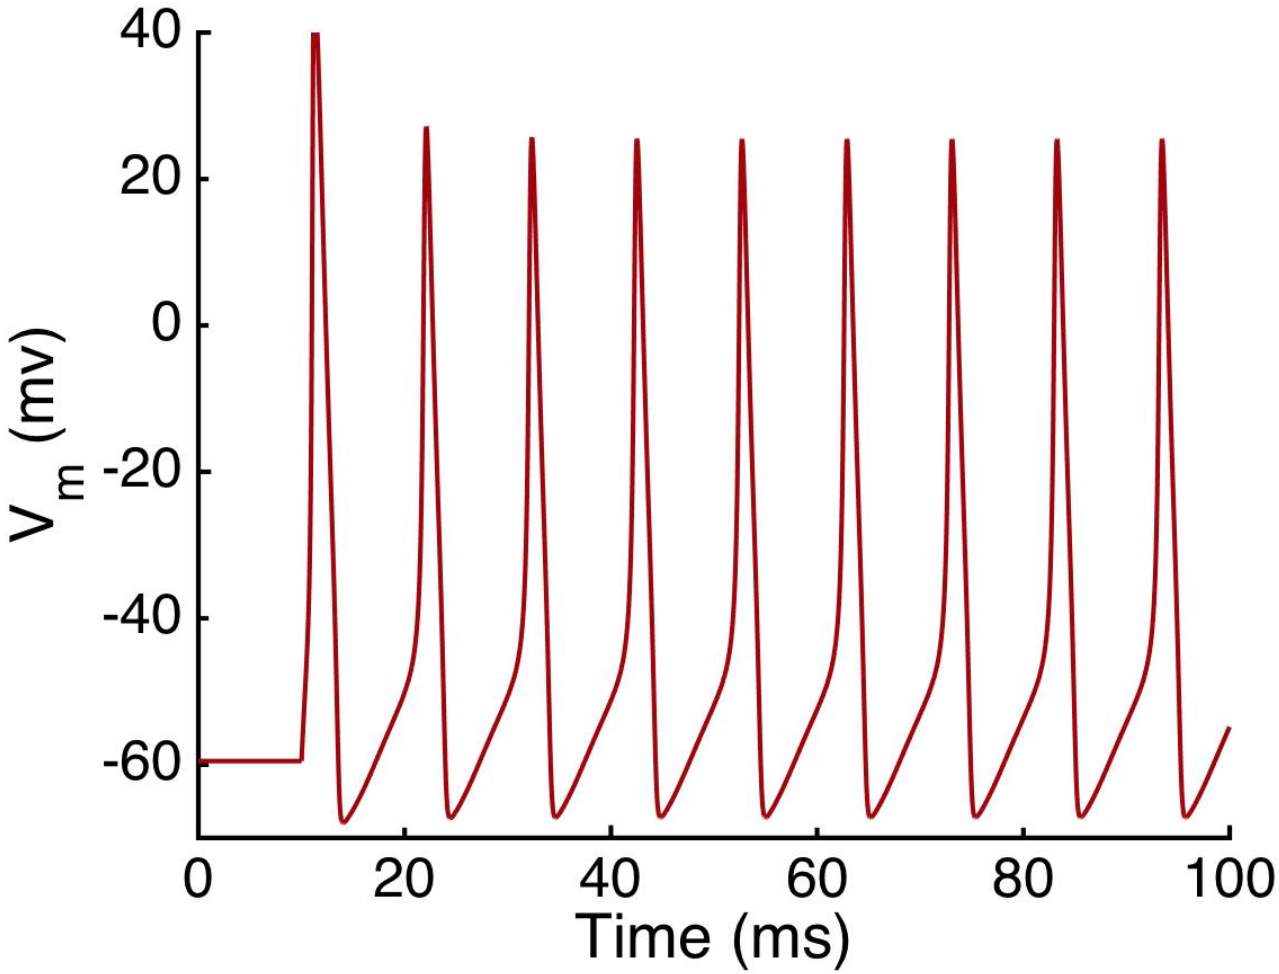
HH Model's step current response starting at 0 $\mu A/cm^2$



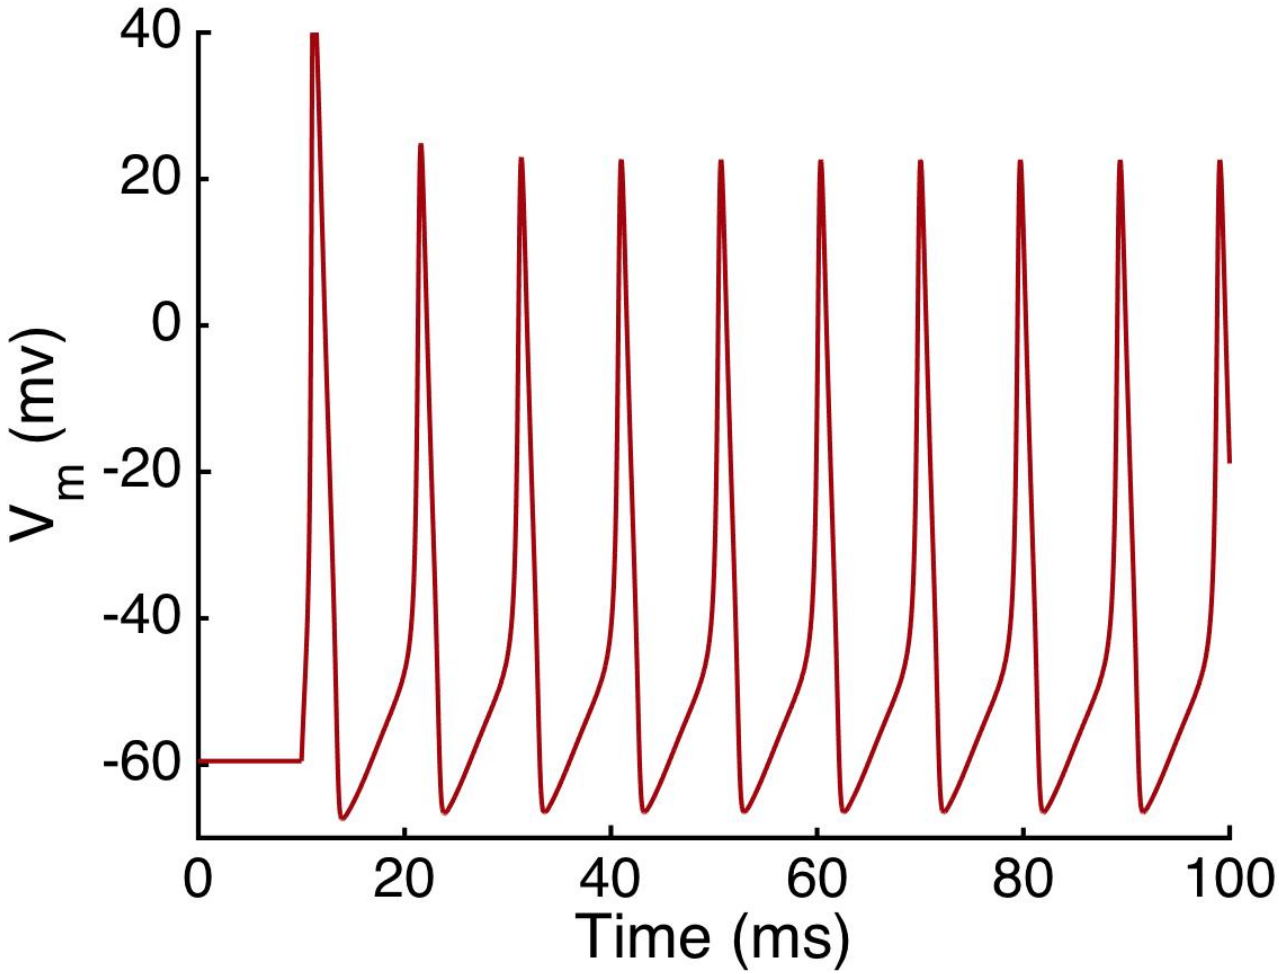
HH Model's step current response starting at 0 $\mu A/cm^2$



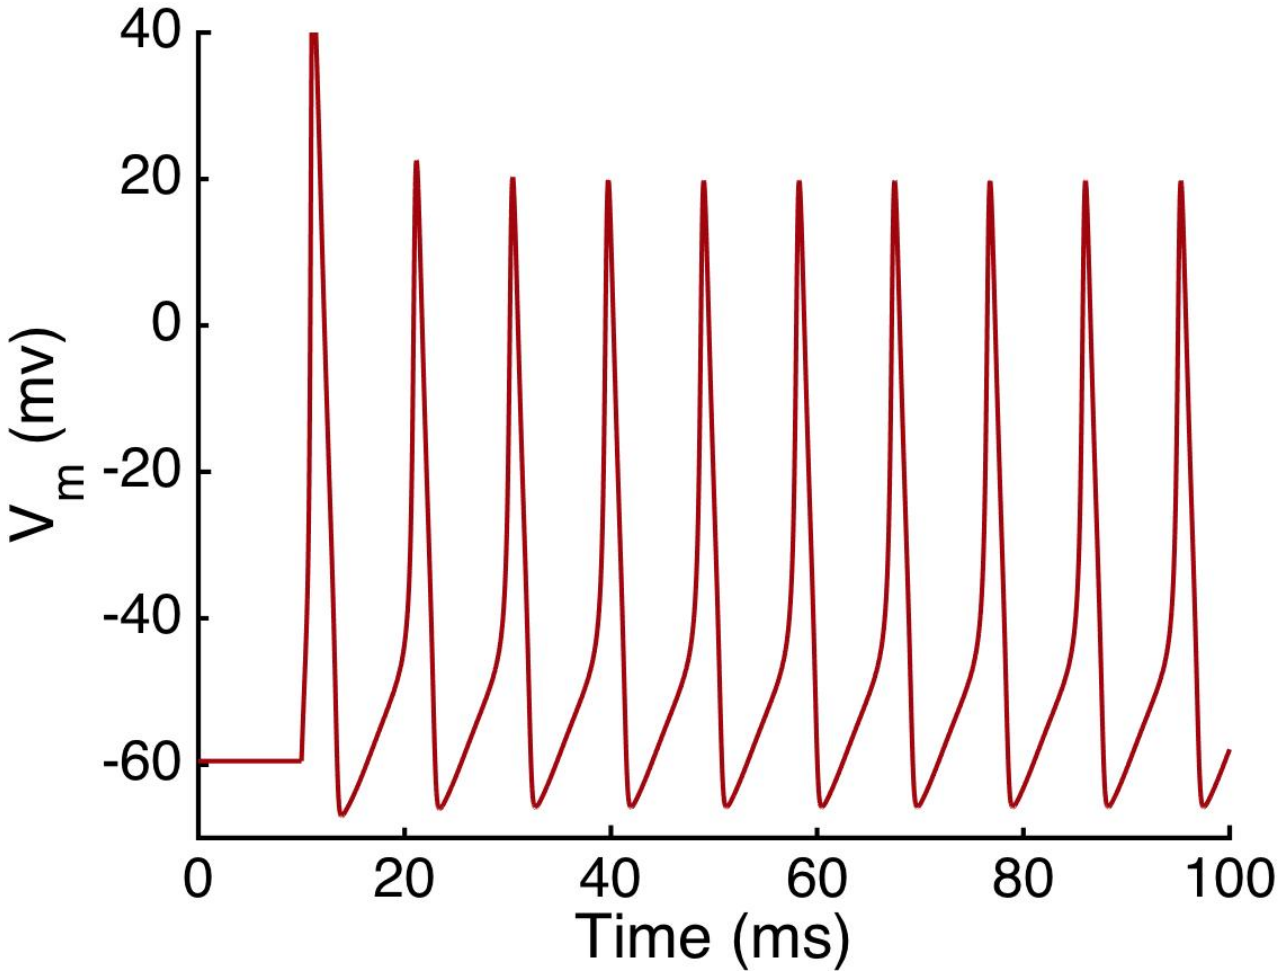
HH Model's step current response starting at 0 $\mu A/cm^2$



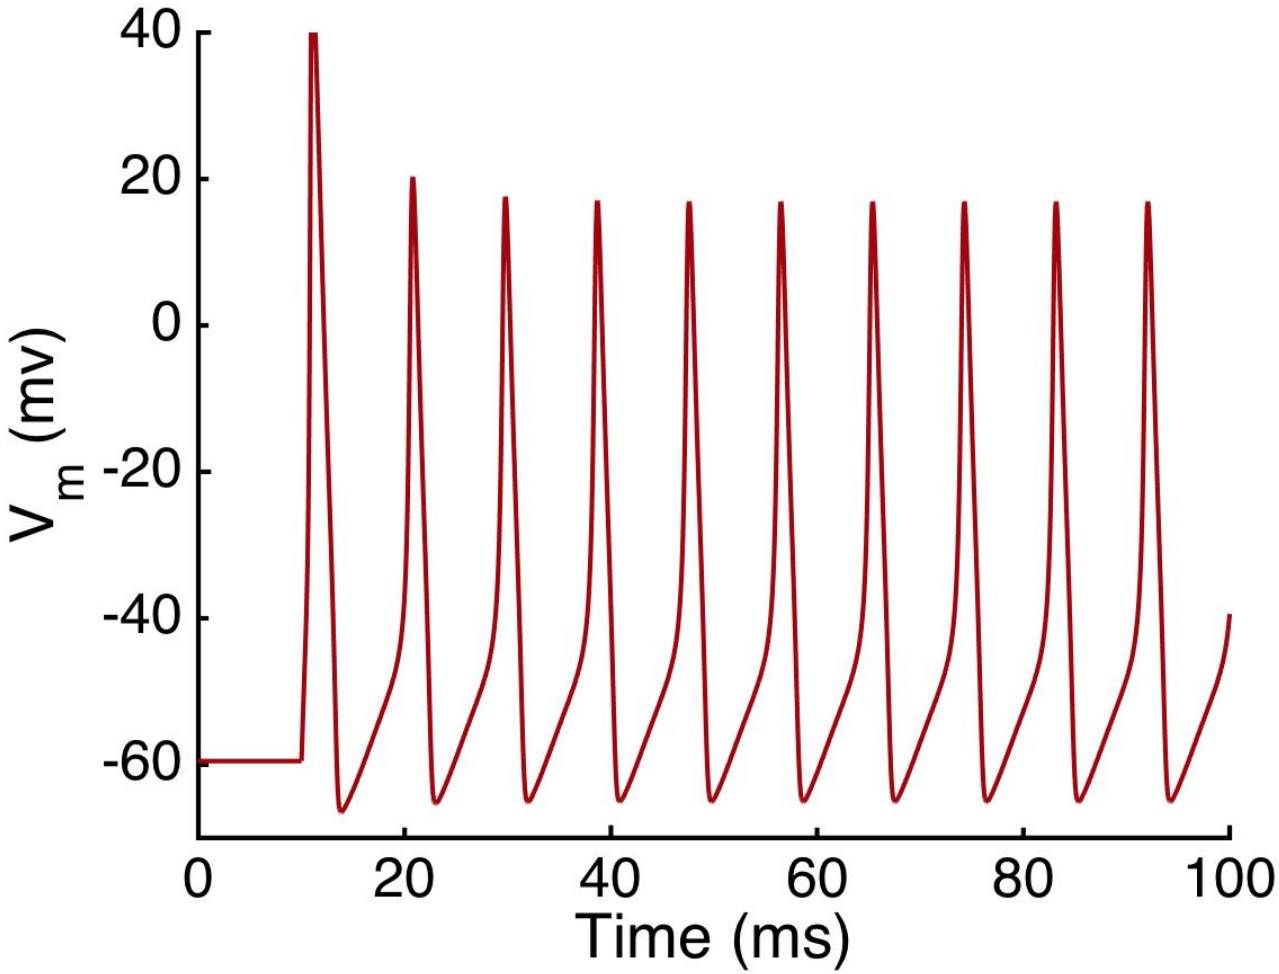
HH Model's step current response starting at 0 $\mu A/cm^2$



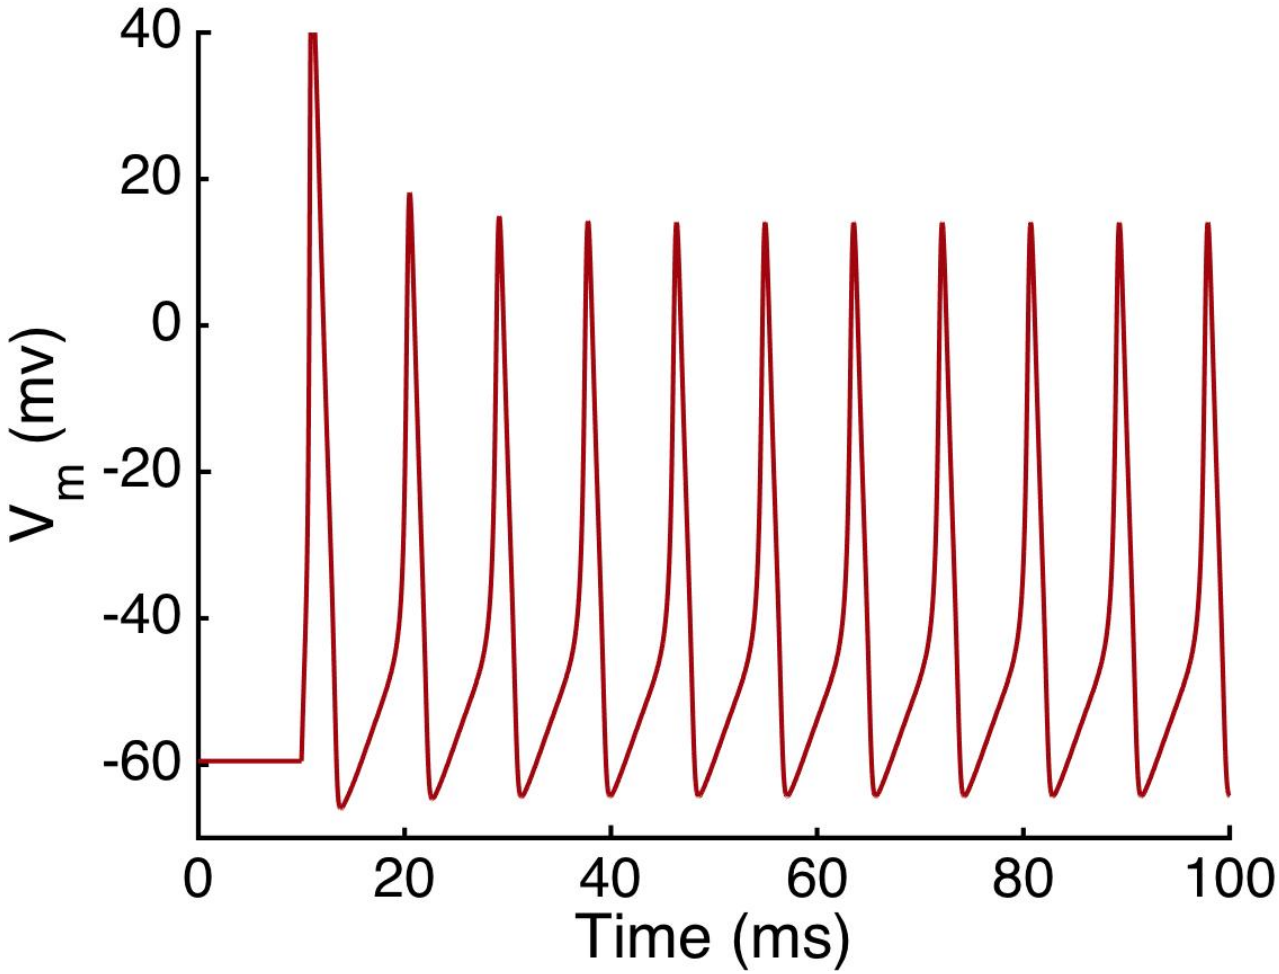
HH Model's step current response starting at 0 $\mu A/cm^2$



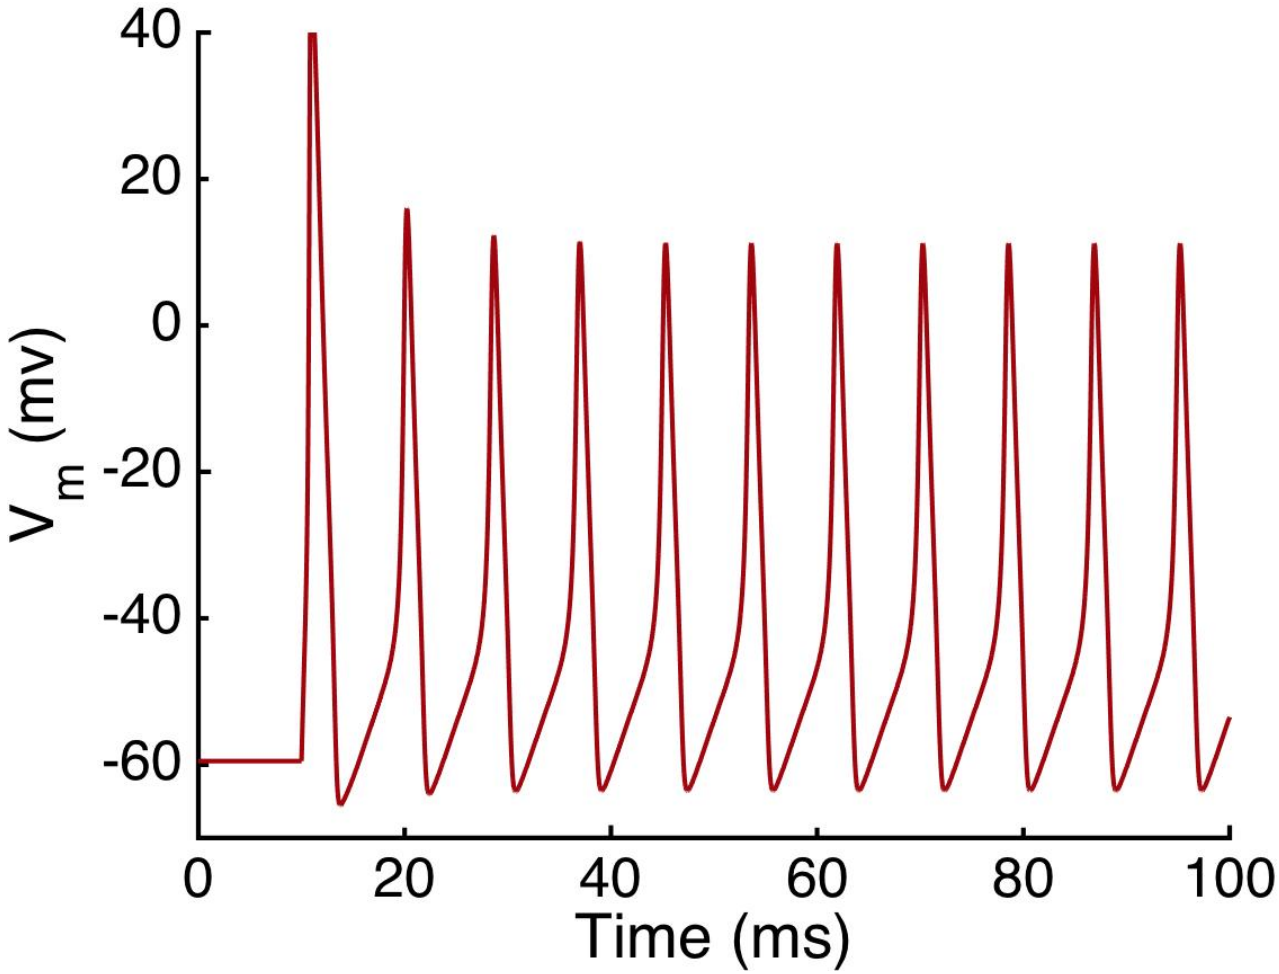
HH Model's step current response starting at 0 $\mu A/cm^2$



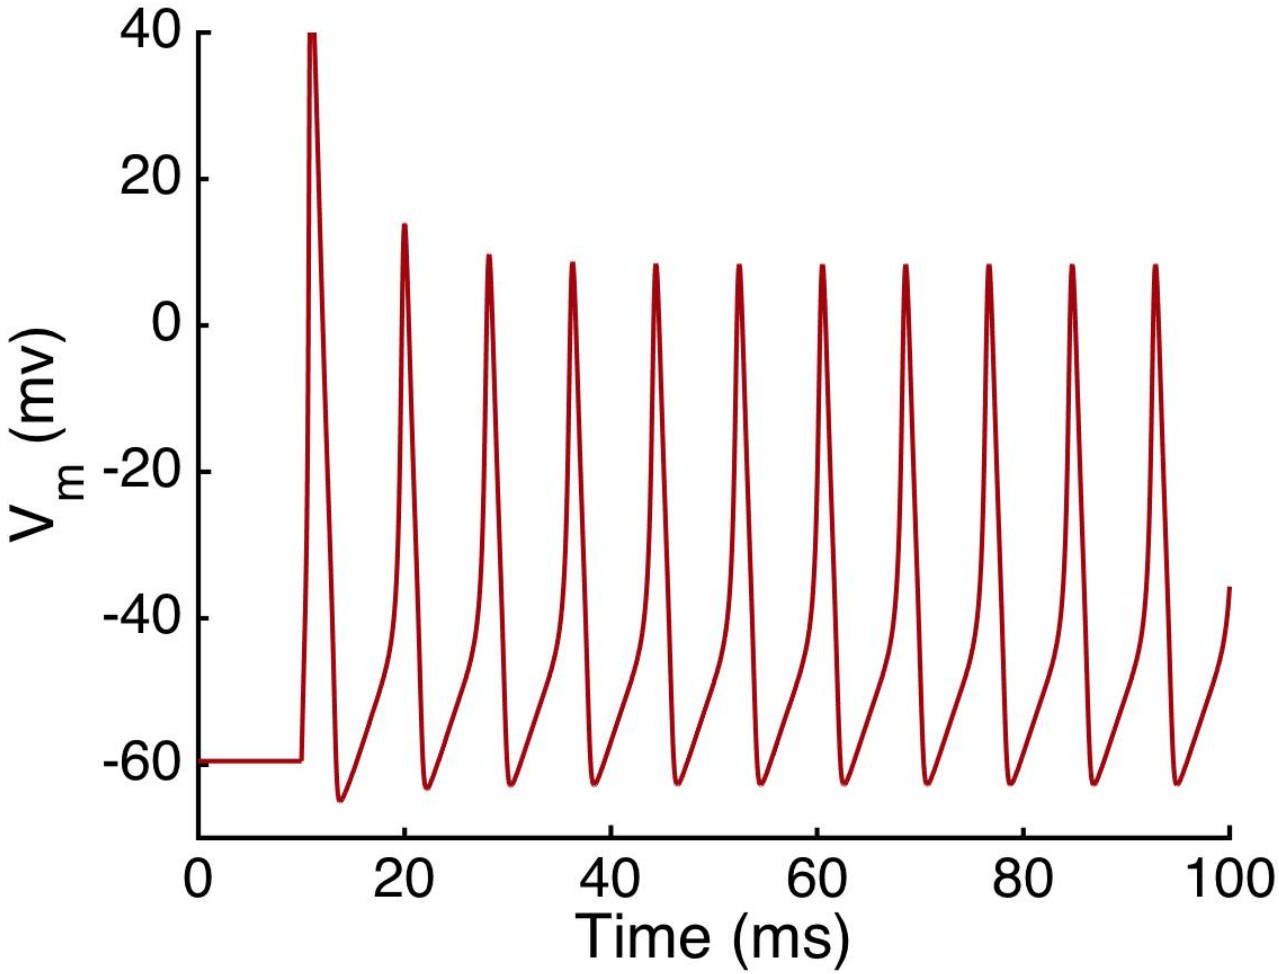
HH Model's step current response starting at 0 $\mu A/cm^2$



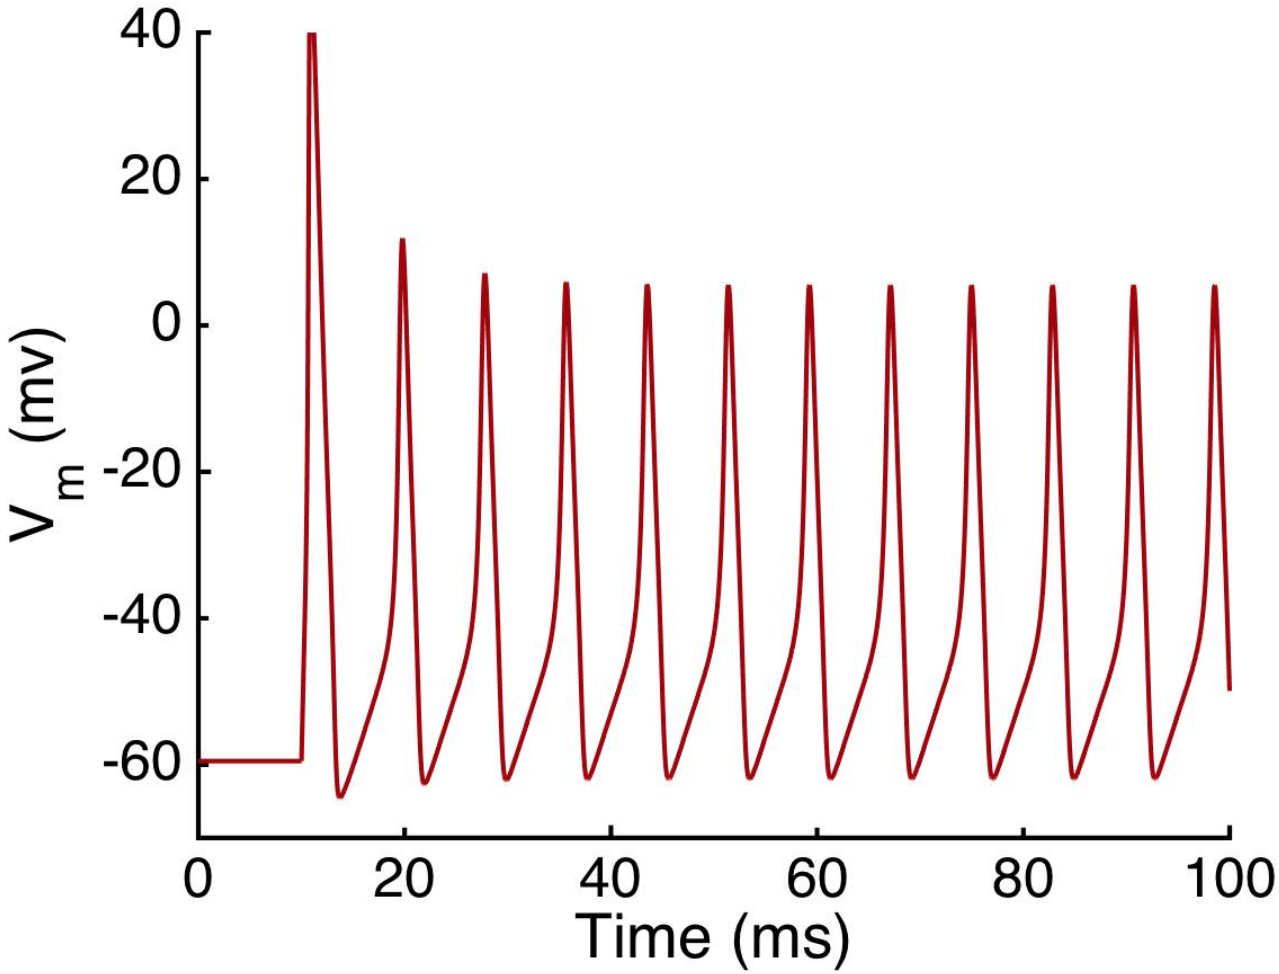
HH Model's step current response starting at 0 $\mu A/cm^2$



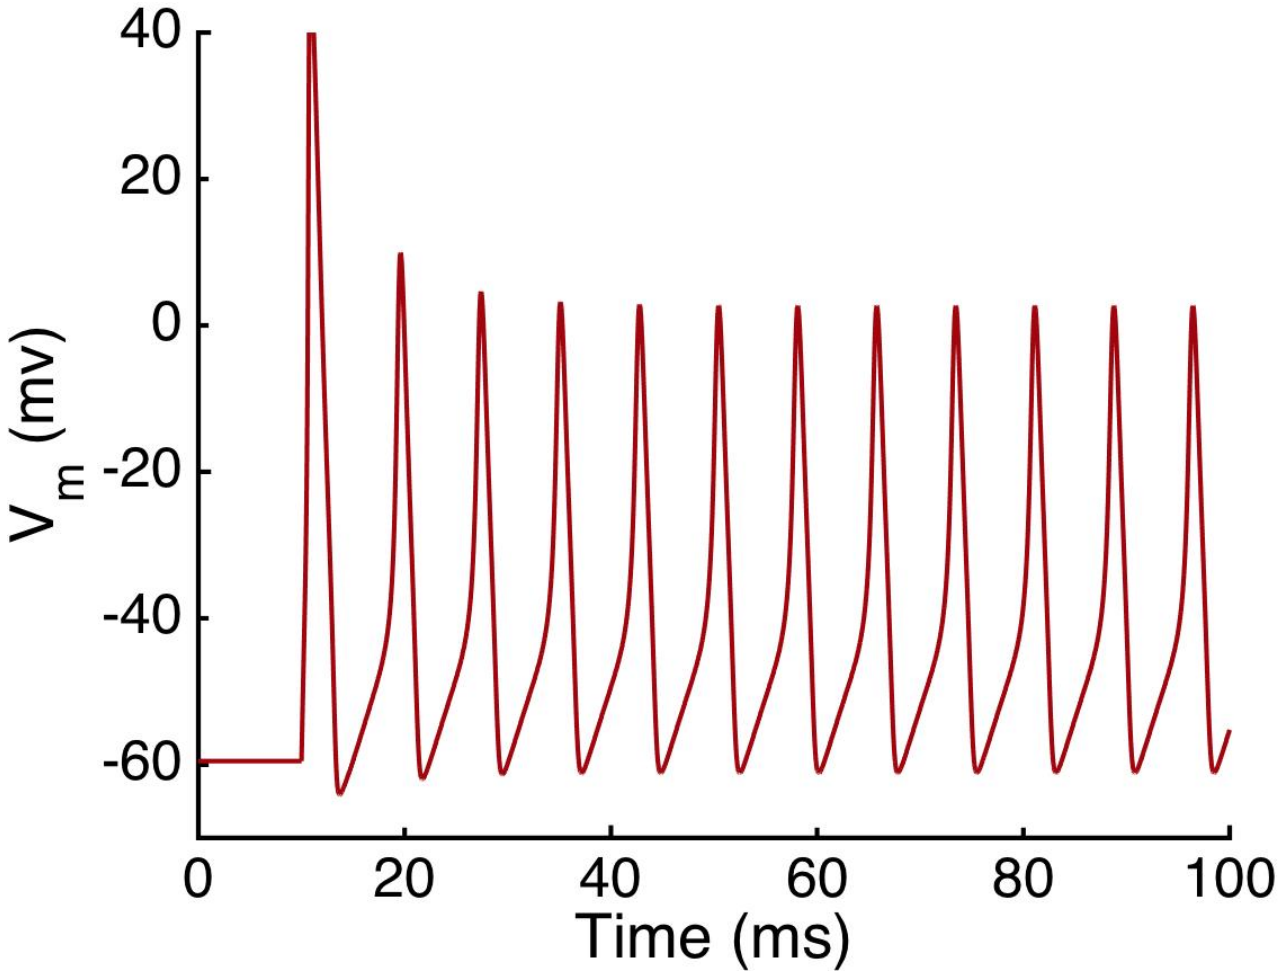
HH Model's step current response starting at 0 $\mu A/cm^2$



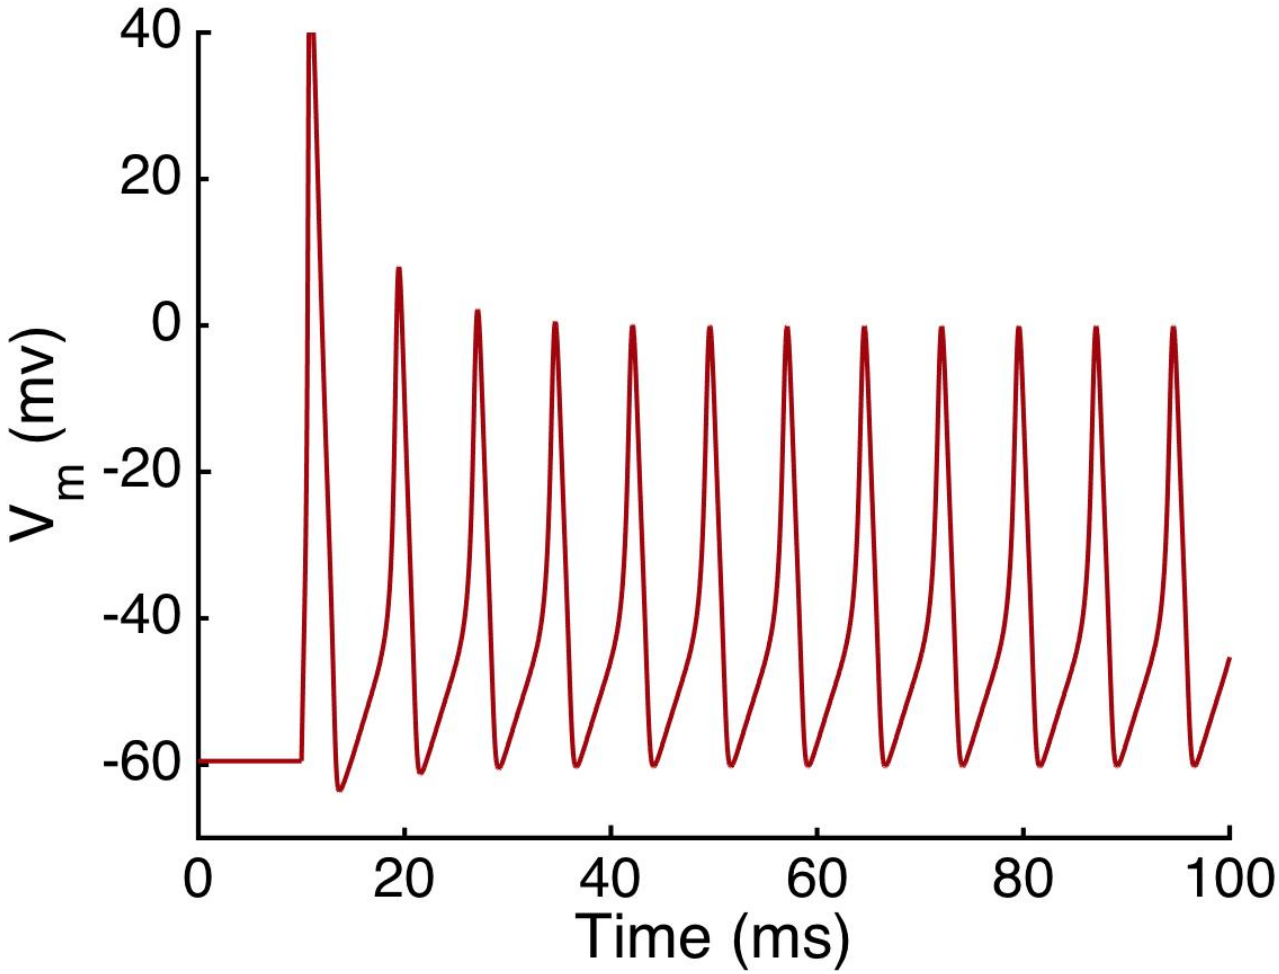
HH Model's step current response starting at 0 $\mu A/cm^2$



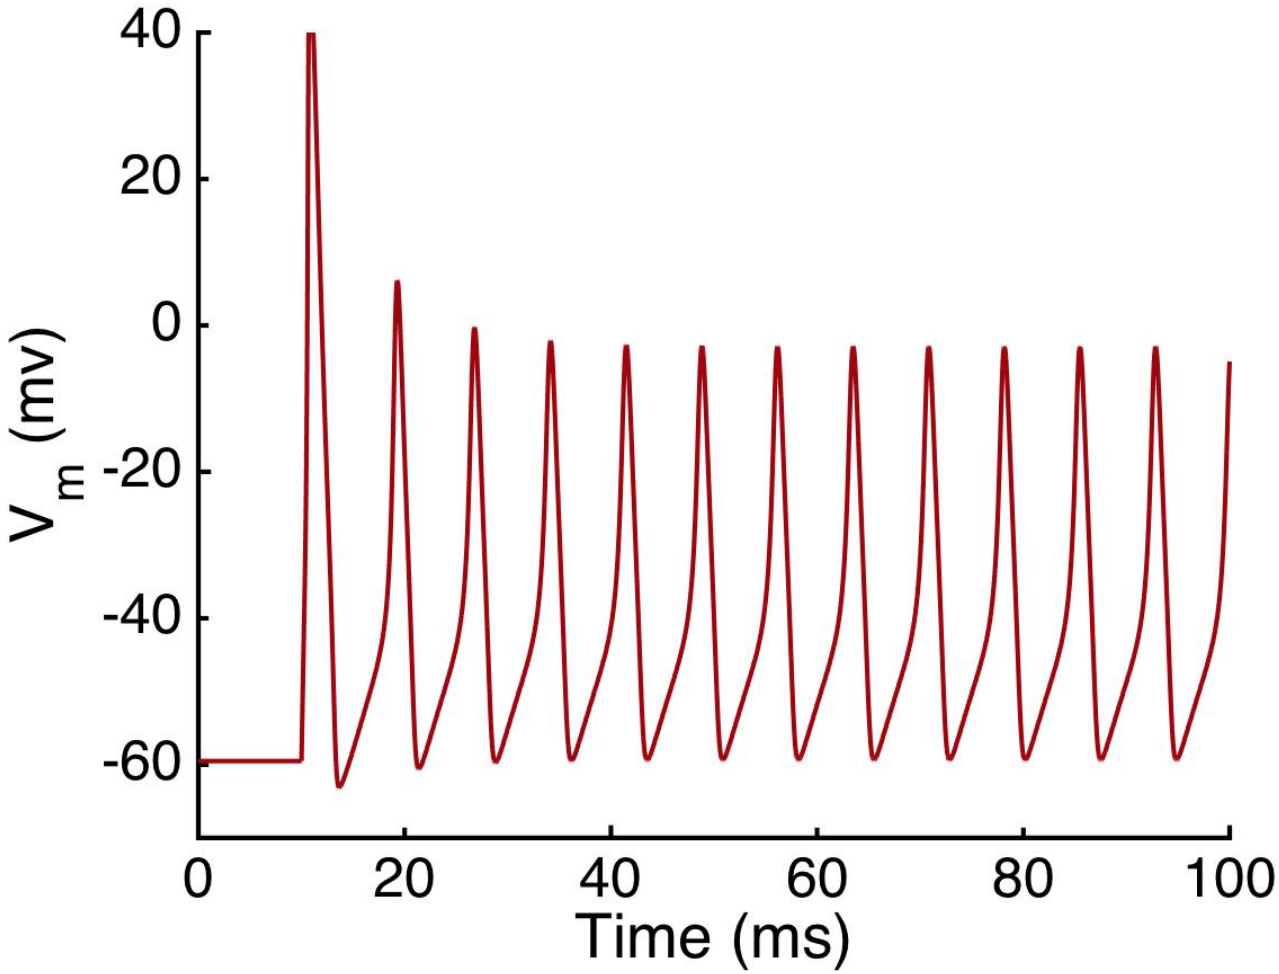
HH Model's step current response starting at 0 $\mu A/cm^2$



HH Model's step current response starting at 0 $\mu A/cm^2$

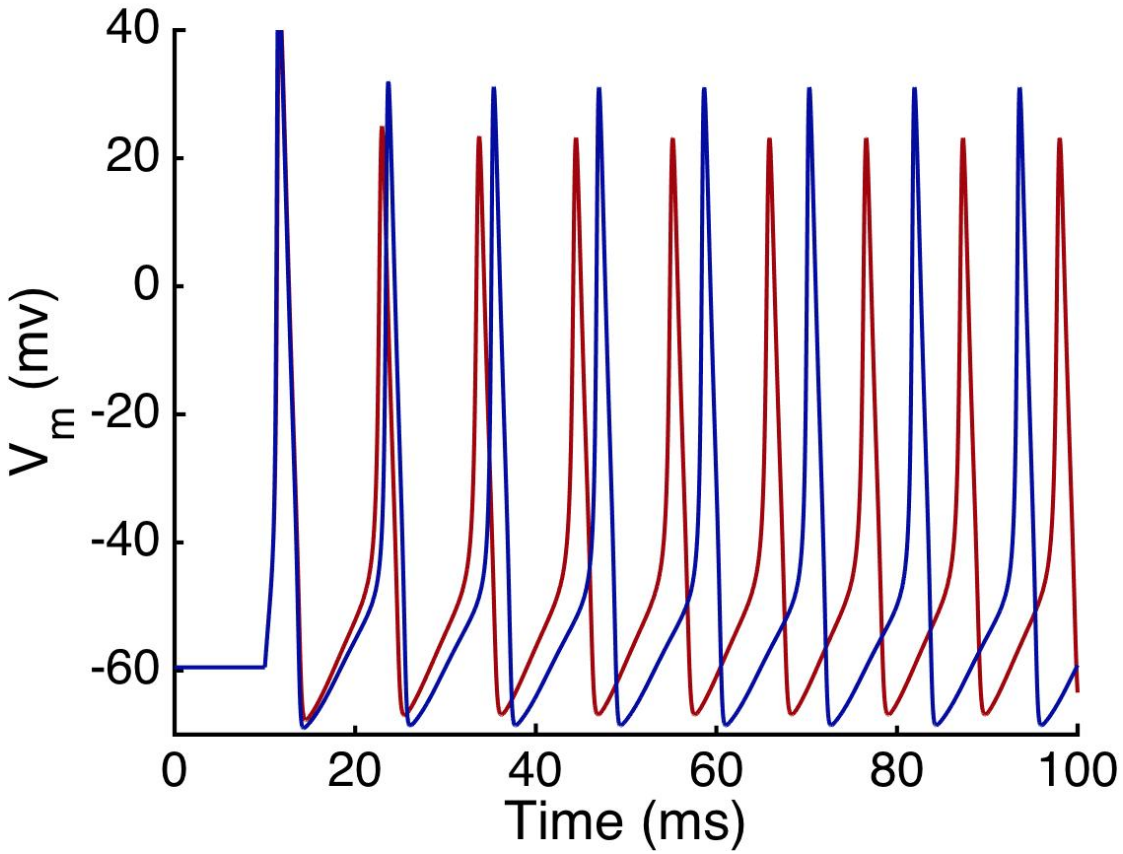


HH Model's step current response starting at 0 $\mu A/cm^2$



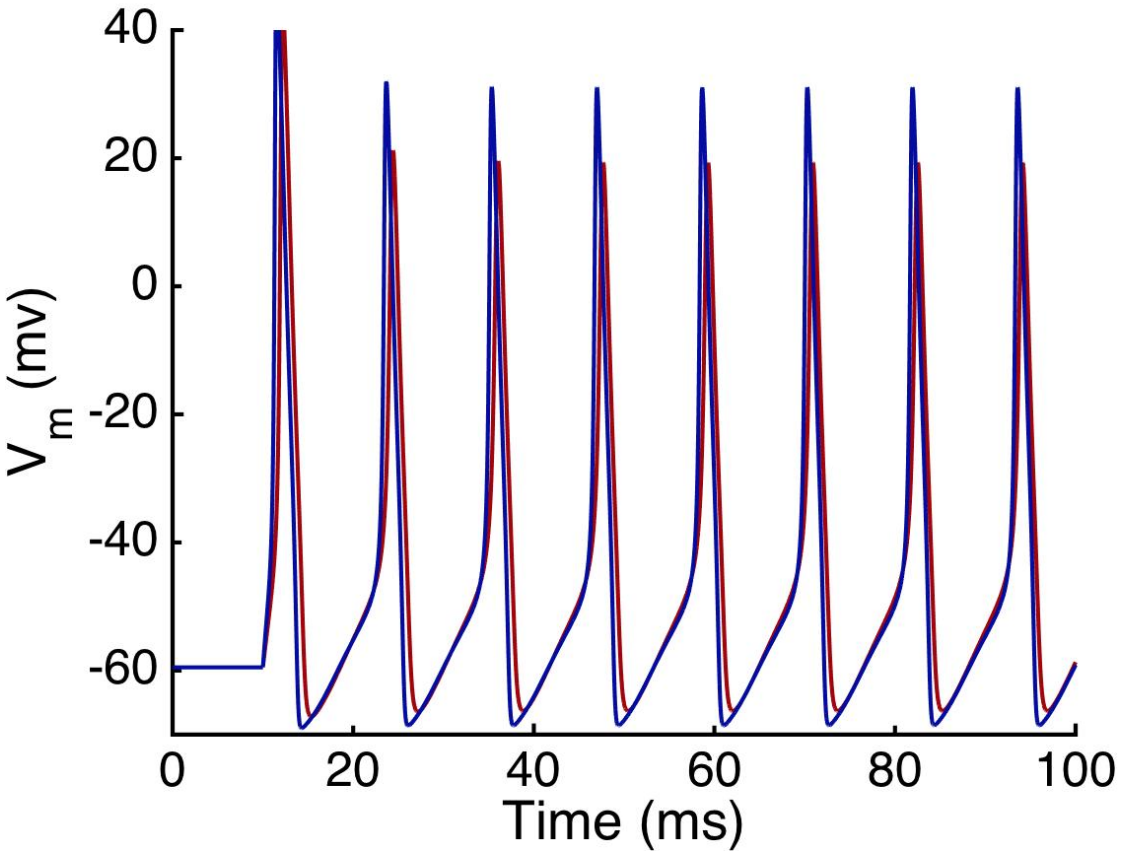
HH Model's step current response starting at 0 $\mu A/cm^2$

Naive Mechanism



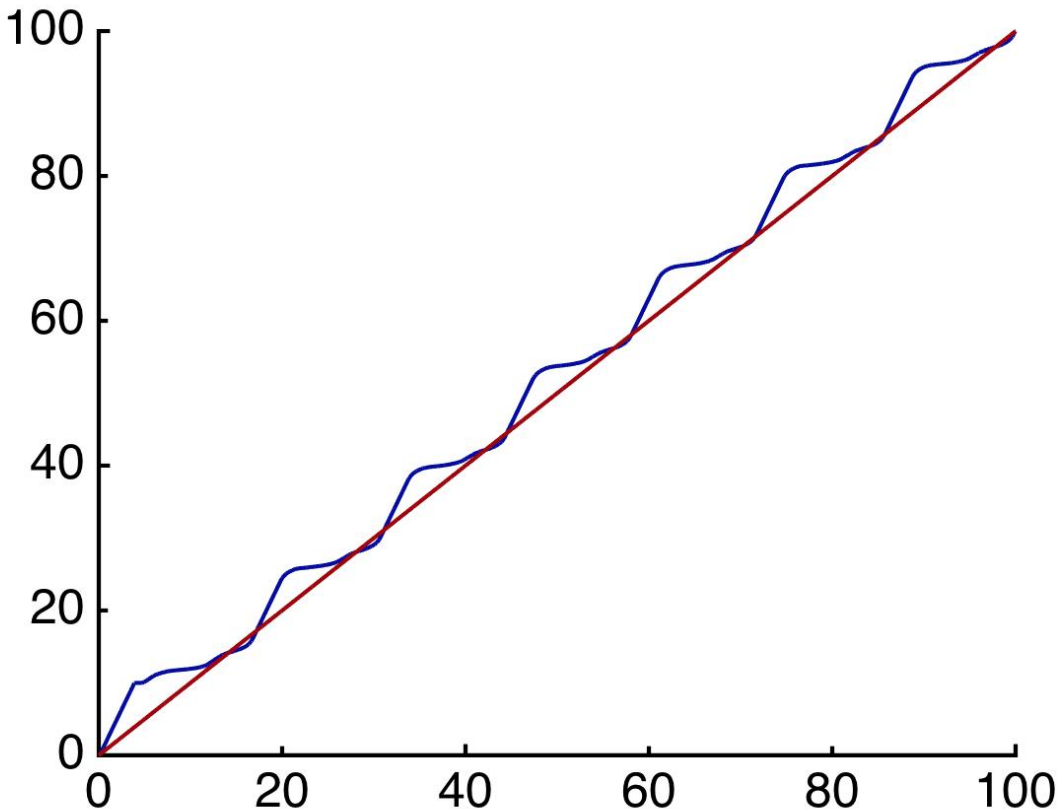
Equal ratio of current to capacitance

Mechanism



Unequal ratio of current to capacitance

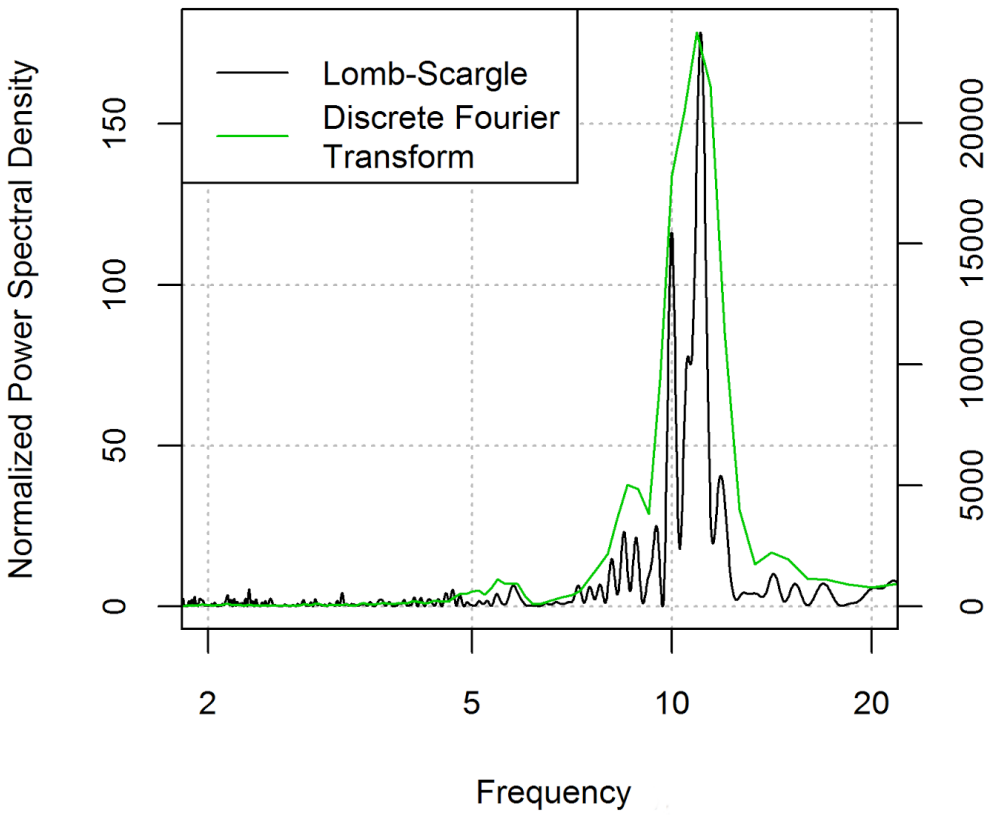
Fourier Transform insufficient: Inconsistent Time Intervals



FFT insufficient,

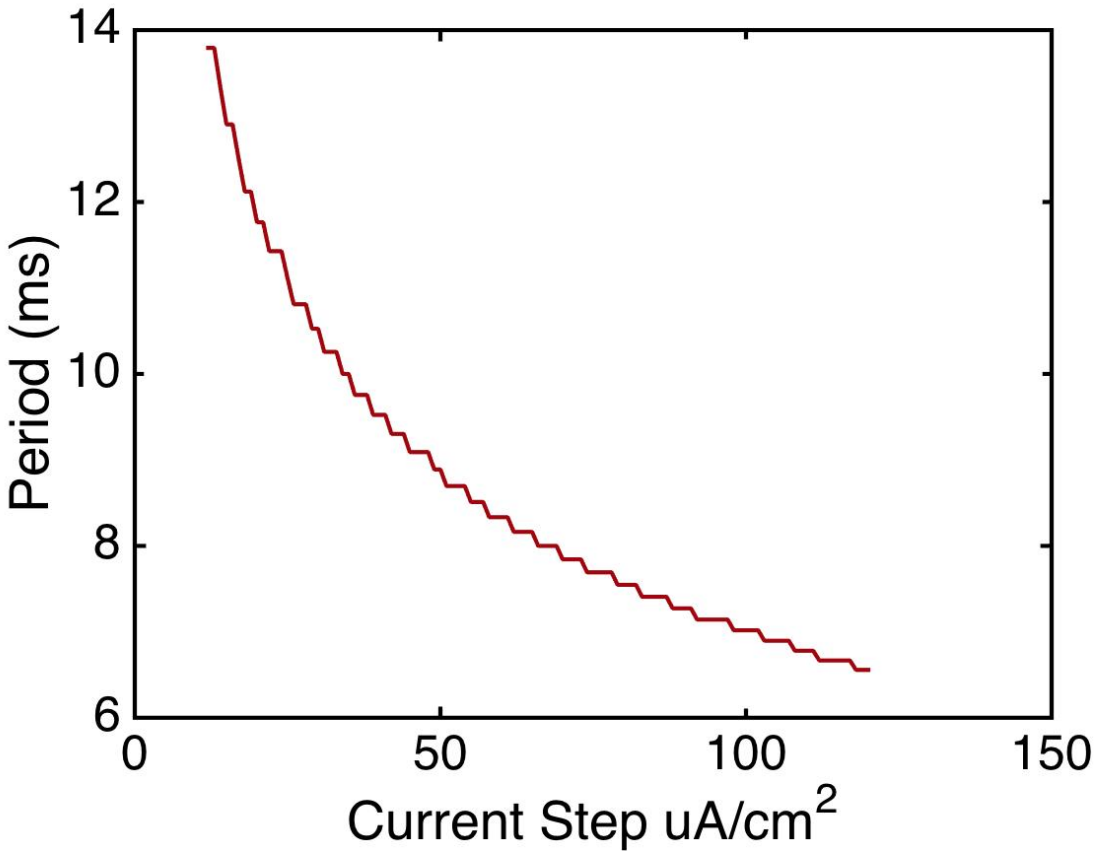
need a better Spectral Analysis Method

Least-squares spectral analysis



The Lomb-Scargle Periodogram works with variable intervals.

Train period over increasing input step

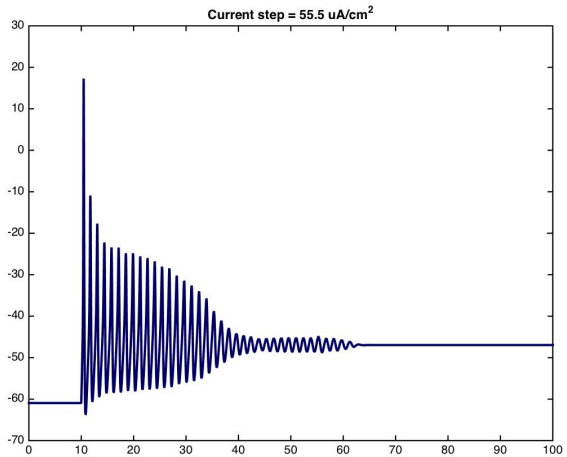


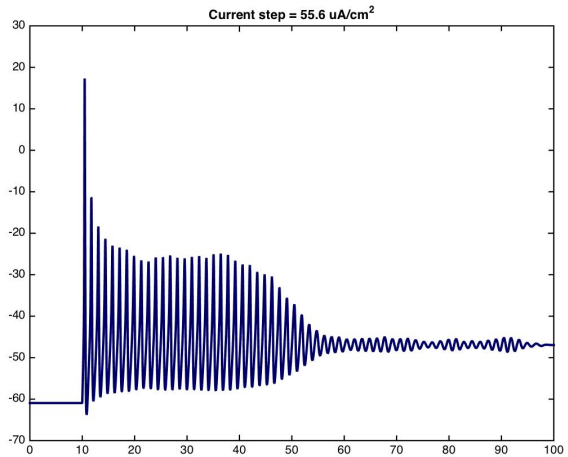
Nonlinearity shows complexity of behavior

Opportunities for Future Research

1. Experiment with decreasing the refactory period by changing the membrane capacitance.
2. Isolate neurons by disabling parts of the axon with train potentials.
3. Study isolated neuron responces.

Anomalies with precision approximation





Incorrect behavior due to low precision
